Proxy Setup Guide

WrksNet Static Proxies

This guide shows you how to connect your WrksNet proxy on iPhone, Android and your computer. Your proxy needs a **username and password**, which are included in the message the bot sends you when you order.

1. What you receive

After you order, the bot sends your proxy in this format:

```
IP:PORT:USERNAME:PASSWORD

example   185.xxx.xxx.xxx:8000:your-username:your-password
```

Part	What it is	Where you enter it
IP	The proxy address (also called host or server)	Host / Server / Address
PORT	The number after the IP	Port
USERNAME	Your proxy login name	Username / User
PASSWORD	Your proxy password	Password

Which setup should I use?

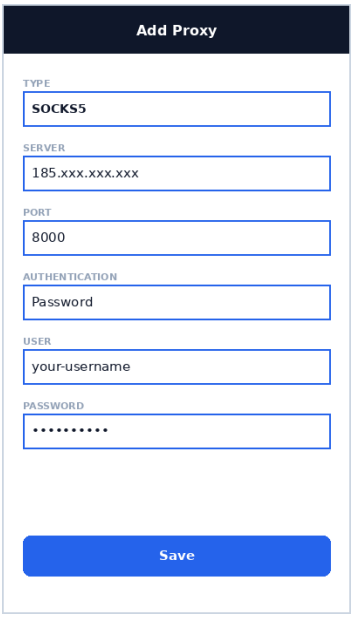

Your device	App or browser	Proxy type
iPhone / iPad	Potatso (free)	SOCKS5
Android	Postern or Drony (free)	SOCKS5
Windows / Mac, Firefox	Firefox settings, no extension needed	HTTP
Windows / Mac, Chrome, Edge or Brave	Your computer's system proxy settings	HTTP

Why HTTP on a computer? Chrome, Edge and Brave cannot sign in to a SOCKS5 proxy that needs a username and password, and Firefox is more reliable with HTTP too. Use the same IP, port, username and password. Only the proxy type changes. On phones, SOCKS5 works well with the apps below.

2. iPhone and iPad (Potatso)

iOS's built-in Wi-Fi proxy settings do not support SOCKS5. Potatso is a free, widely-used app that adds it.

1. Download **Potatso** for free from the App Store.
2. Open Potatso and tap **Add a Proxy**.
3. Under the Manual Input section, tap **Add**.
4. Set **Type** to **SOCKS5**.
5. Enter your proxy's **Server** (the IP) and **Port**.
6. Under **Authentication**, choose **Password**. Two new fields open: enter your **Username** and **Password**.
7. Save the profile, then tap the **Play** icon to switch it on.
8. If prompted, tap **Allow** and enter your device passcode so Potatso can add a VPN configuration. This is how it routes traffic on iOS. It does not mean you are using a VPN service.

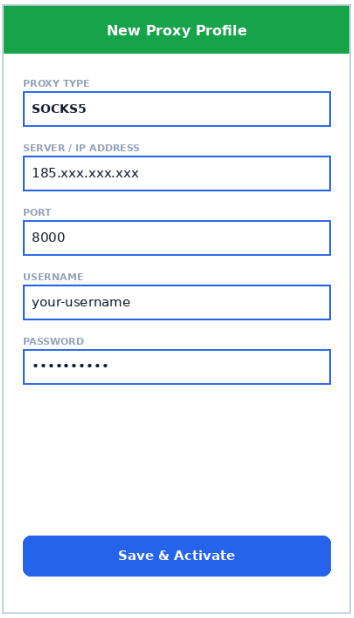

Potatso "Add Proxy" with SOCKS5 and Authentication set to Password.

3. Android (Postern or Drony)

Android's system Wi-Fi settings do not support SOCKS5 proxies, so use a proxy app. **Postern** and **Drony** are both free.

1. Install **Postern** (or Drony) from the Google Play Store.
2. Open the app and create a new proxy profile.
3. Set the proxy type to **SOCKS5**.
4. Enter your proxy's **Server** (the IP) and **Port**.
5. Turn on authentication and enter your **Username** and **Password**.
6. Save and activate the profile. The first time you connect, Android asks permission to add a VPN configuration. Tap **OK**. This is how these apps route traffic. You are not connecting to a VPN service.

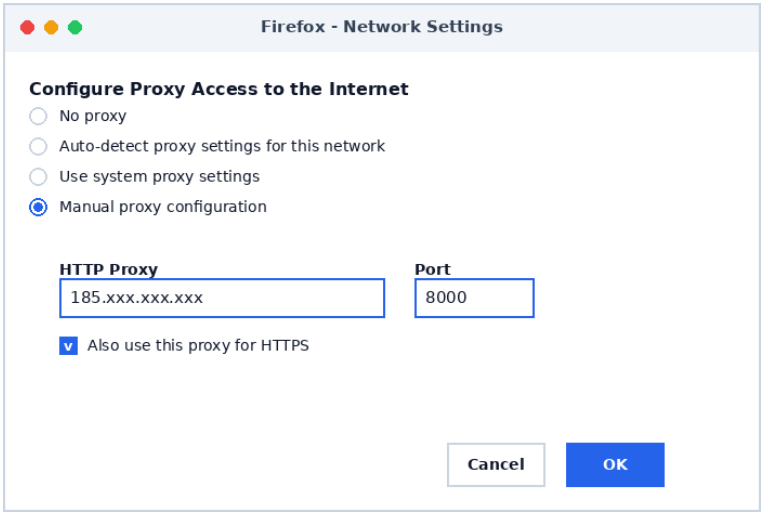

Postern-style profile with SOCKS5, username and password. Layout varies slightly between apps.

Safety tip: only install proxy apps from the official App Store or Google Play. Avoid APK files from other websites, as they carry a higher risk of malware.

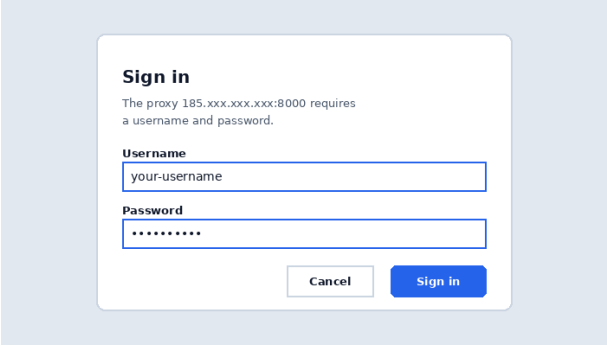

4. Windows and Mac: Firefox

Firefox has its own proxy settings, so it does not touch the rest of your computer.

1. Open Firefox, click the menu button (three lines, top right) and choose **Settings**.
2. Scroll to **Network Settings** near the bottom of the General tab and click **Settings…**
3. Select **Manual proxy configuration**.
4. In **HTTP Proxy**, enter your proxy's IP. In **Port**, enter the port number.
5. Tick **Also use this proxy for HTTPS**. Leave the SOCKS Host field empty.
6. Click **OK**, then open any website.
7. A sign-in box appears. Enter your **Username** and **Password**. Tick "Remember" if you do not want to enter them again.
8. To switch it off later, return to the same screen and choose **No proxy**.

Firefox Network Settings with Manual proxy configuration and the HTTP Proxy filled in.

The sign-in box your browser shows. Enter the username and password from your proxy message.

5. Windows and Mac: Chrome, Edge and Brave

These browsers use your computer's system proxy settings. Once it is on, other apps on your computer that follow the system settings will use the proxy too.

Windows 10 and 11

1. Open **Settings** › **Network & internet** › **Proxy**.
2. Under **Manual proxy setup**, click **Set up**.
3. Turn on **Use a proxy server**. Enter your proxy's IP in **Proxy IP address** and the number in **Port**.
4. Click **Save**, then open Chrome, Edge or Brave and visit any website.
5. When the sign-in box appears, enter your **Username** and **Password**.
6. To switch it off later, turn **Use a proxy server** off.

Mac

1. Open **System Settings** › **Network**, select your Wi-Fi or Ethernet connection and click **Details**.
2. Open the **Proxies** tab and turn on **Web Proxy (HTTP)** and **Secure Web Proxy (HTTPS)**.
3. For each one, enter the IP and port, turn on **Proxy server requires password**, and enter your username and password.
4. Click **OK**, then **Apply**. To switch it off later, turn both proxies off.

6. Checking that it works

1. With the proxy switched on, open a browser and visit a site such as **whatismyipaddress.com** or **ip.me**.
2. Check that the IP address shown matches the proxy IP you were given, not your real IP.
3. If you still see your real IP, make sure the proxy is switched on and the IP and port were entered correctly.

7. Troubleshooting

Q: It keeps asking for a username and password.

A: Enter the username and password from your proxy message. Copy and paste them to avoid typing mistakes. A space at the end is the most common cause of a failed sign-in.

Q: My internet stopped working after setting up the proxy.

A: Check the IP and port exactly as sent, with no extra spaces. In Potatso and Postern the type must be **SOCKS5**. In a browser or system settings it must be **HTTP**.

Q: Pages are loading slowly.

A: Switch the proxy off and on again, or try another network. If it continues, contact support.

Q: My proxy IP stopped working.

A: In the bot, tap **Our Services** › **Proxies** › **Manage Proxies**, open your proxy and tap **Swap IP**. You get one swap per proxy until you renew it.

Q: My proxy expired.

A: Tap **Our Services** › **Proxies** › **Manage Proxies**, open the proxy and tap **Renew**.

Q: How do I turn the proxy off?

A: Firefox: choose **No proxy** in Network Settings. Windows and Mac: turn the system proxy off. Potatso and Postern: tap Stop or Disconnect in the app.

Still stuck? Open the WrksNet bot and tap **Contact Support**. Include your order ID and what you see on screen, and we will help you.
