Setting up your proxy

WRKSNET • PROXY SETUP GUIDE

iPhone, Android, Firefox and Chrome. Every step shown.

What you have bought

A static residential IP in the country you chose, yours for one month. It is not shared with anyone else and it does not rotate, so the same IP stays with you for the whole period.

It works over both **SOCKS5** and **HTTP**, on the same port. The phone apps in this guide use SOCKS5; Firefox, Chrome and the optional iPhone Wi-Fi method use HTTP. You don't need to choose: just follow the method for your device.

Your four details

Every method uses the same four values, and nothing else:

YOUR PROXY	
IP address	**123.45.67.89**
Port	**40000**
Username	**yourusername**
Password	**yourpassword**

Example values. Yours are in the message the bot sent when your order completed. To see them again, open **Our Services** › **Proxies** › **Manage Proxies**.

Which method should I use?

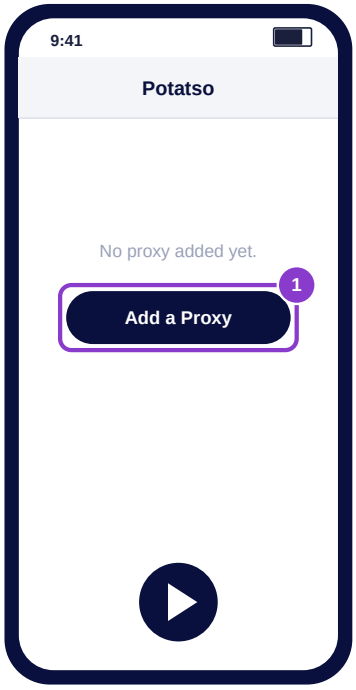
You are using	Use	Page
iPhone or iPad	The **Potatso** app (Method 1)	2
iPhone on Wi-Fi, no app	iPhone Wi-Fi settings (optional, Wi-Fi only)	3
Android phone	The **Super Proxy** app (Method 2)	4
Firefox on a computer	Firefox's own settings (Method 3)	5
Chrome on Windows	Windows proxy settings (Method 4)	6

About the pictures

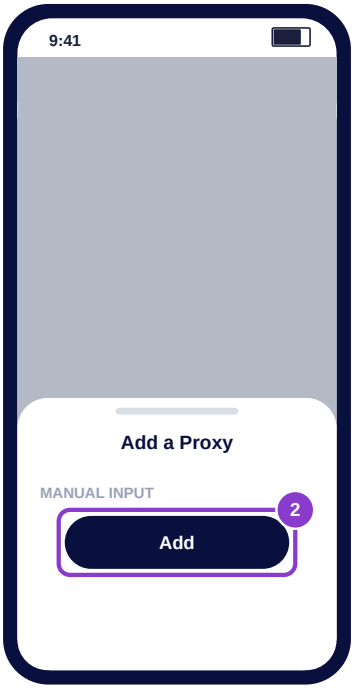
Every screen in this guide is a drawing that shows exactly where to tap. The numbered purple circles match the numbered steps underneath. Colours and small details on your own device may look a little different, but the buttons and their names are the same.

Method 1 — iPhone, using Potatso

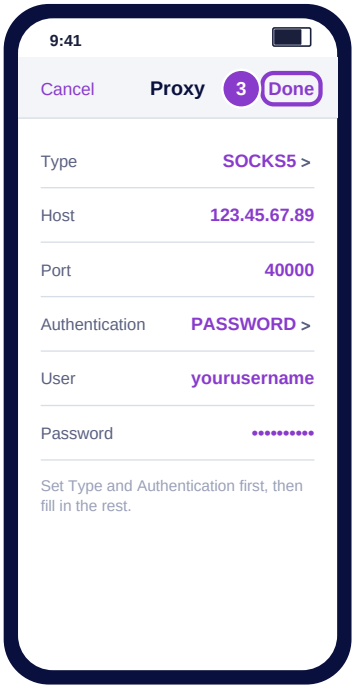
Install **Potatso** from the App Store. It covers Wi-Fi and mobile data, and every app on your iPhone.



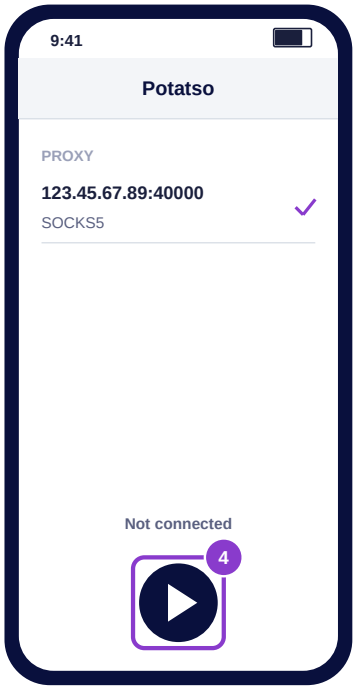
1 Open **Potatso** and tap **Add a Proxy**.



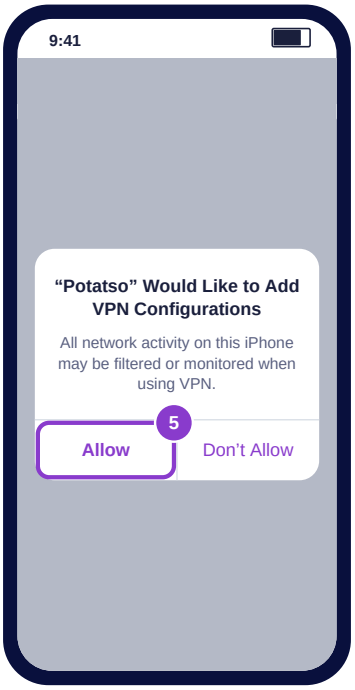
2 In the menu that opens, under **Manual Input**, tap **Add**.



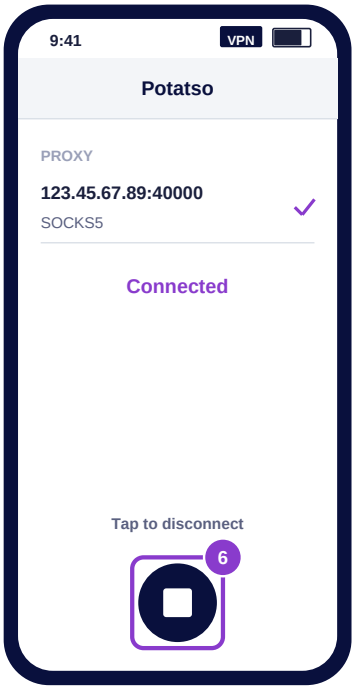
3 Set **Type** to **SOCKS5** and **Authentication** to **PASSWORD**, fill in your four details, then tap **Done**.



4 Back on the main screen your proxy is listed. Tap the **play button** at the bottom.



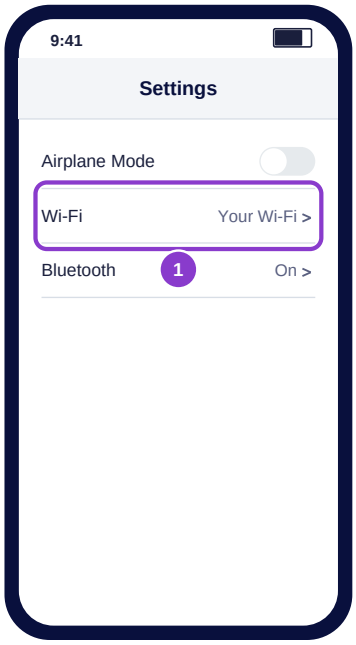
5 Tap **Allow**, then enter your iPhone passcode. This only happens the first time.



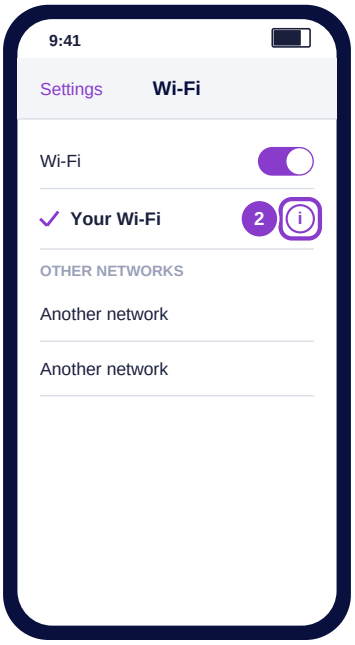
6 Connected. **VPN** shows at the top of the screen. Tap the same button to disconnect.

Optional — iPhone without an app (Wi-Fi only)

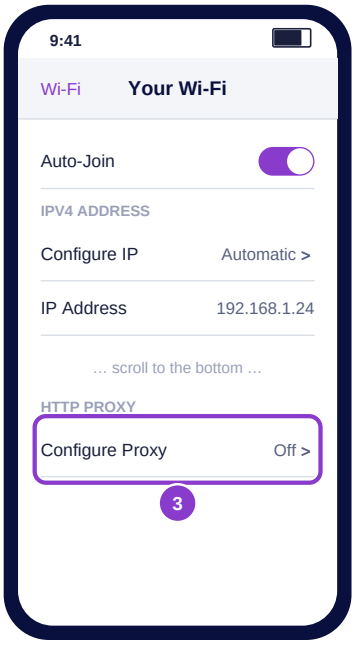
Uses your iPhone's own Wi-Fi settings, with nothing to install. It does not work on every Wi-Fi connection, so if it won't connect, use Method 1 (Potatso) instead.



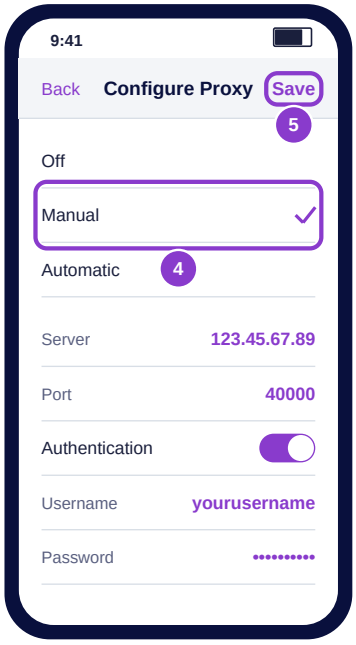
1 Open **Settings** and tap **Wi-Fi**.



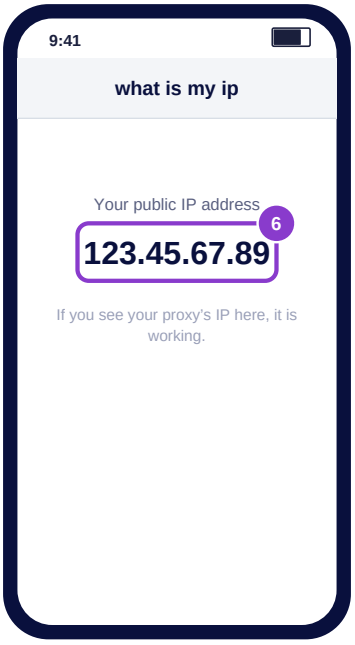
2 Tap the **(i)** next to the Wi-Fi network you are connected to.



3 Scroll right to the bottom of that screen and tap **Configure Proxy**.



4 Choose **Manual**. Enter your IP as **Server** and your **Port**, turn **Authentication** on, then add your username and password. 5 Tap **Save**.



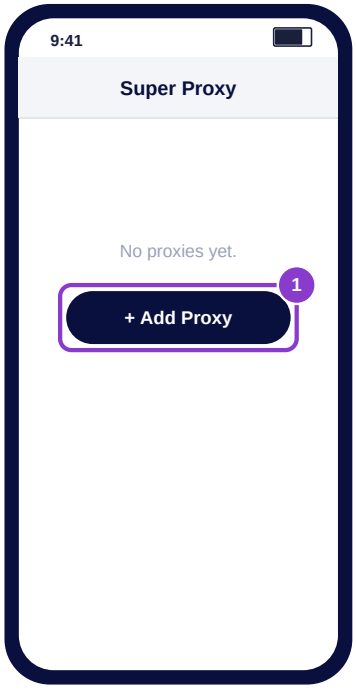
6 In **Safari**, search **what is my ip**. You should see your proxy's IP.

Good to know

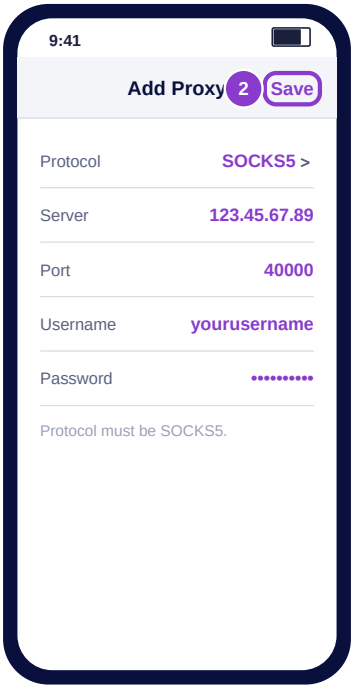
- **Wi-Fi only.** It never covers mobile data.
- **Not every Wi-Fi network allows it.** Hotels, offices and public hotspots often block it. If it won't connect, use Method 1 (Potatso).
- It is saved per network, so set it again on each new Wi-Fi.
- Safari follows it. A few apps ignore it and connect directly.
- To turn it off: **Configure Proxy** › **Off**.

Method 2 — Android, using Super Proxy

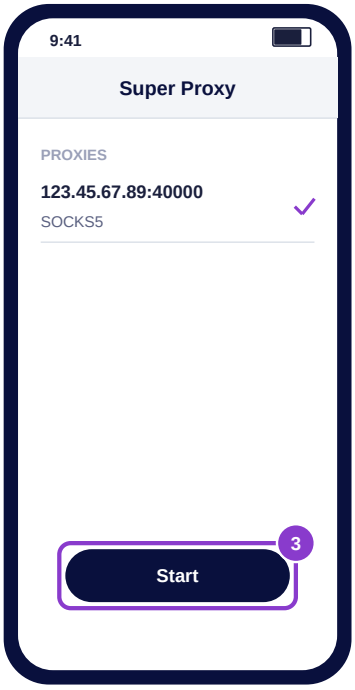
Install **Super Proxy** from the Play Store. It covers Wi-Fi and mobile data, and every app on your phone.



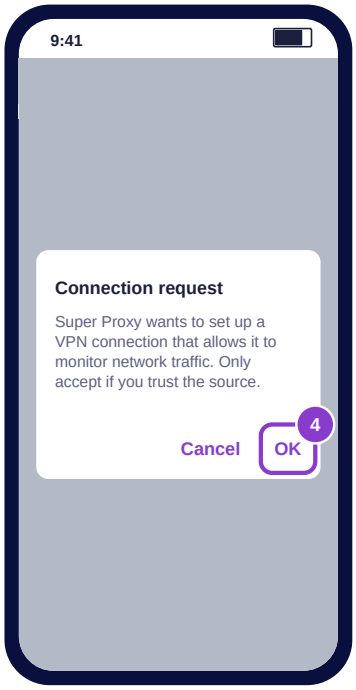
1 Open **Super Proxy** and tap **+ Add Proxy**.



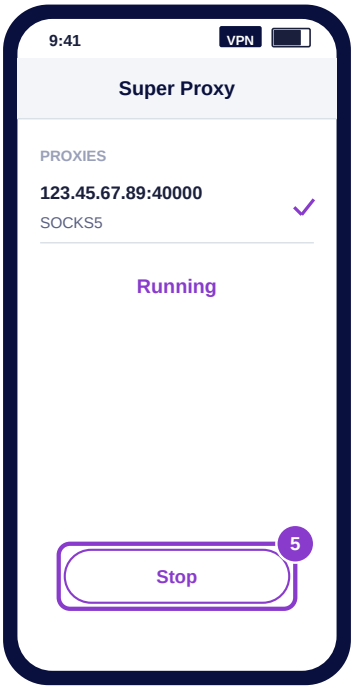
2 Choose **SOCKS5** as the **Protocol**, fill in your four details, then tap **Save** at the top right.



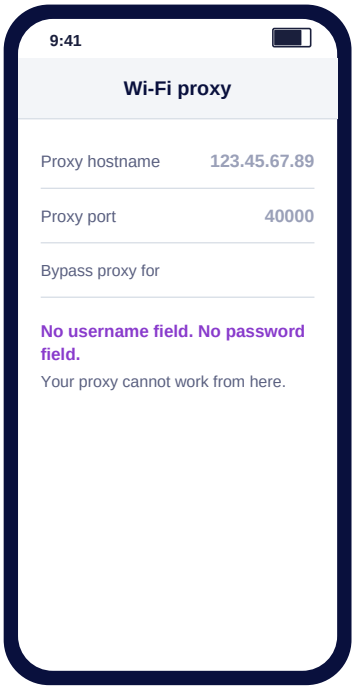
3 Your proxy is listed. Tap **Start**.



4 Android asks for permission. Tap **OK**. This only happens the first time.



5 Running. A key or VPN icon shows at the top. Tap **Stop** to disconnect.

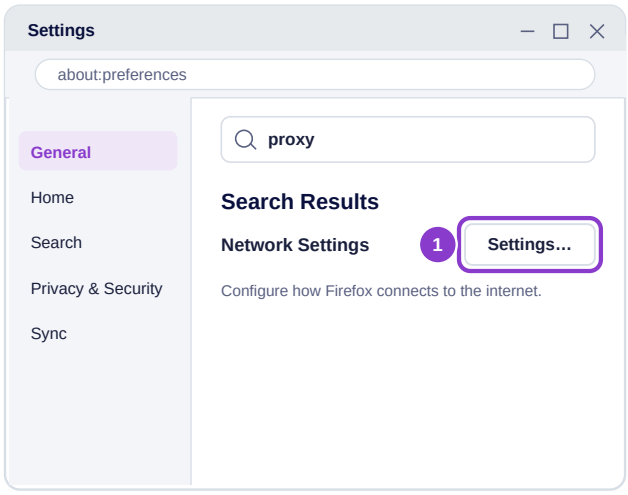


Don't use Android's own Wi-Fi proxy setting. It has no place for your username and password.

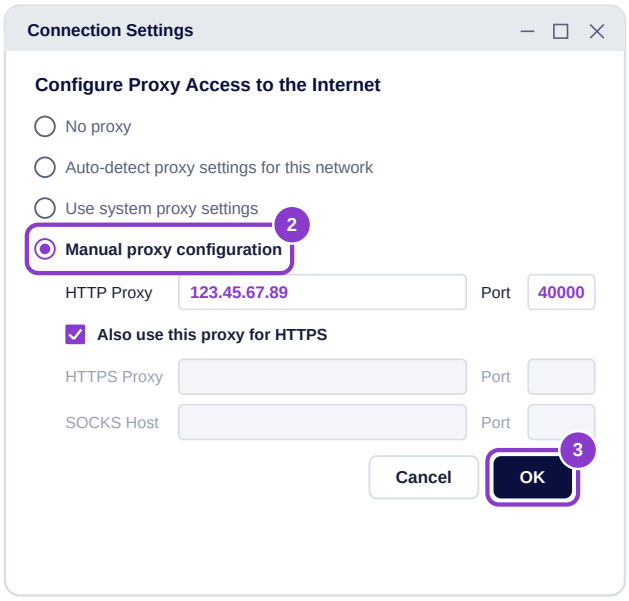
Method 3 — Firefox, through its settings

Nothing to install. This sets the proxy for Firefox only; the rest of your computer is unaffected.

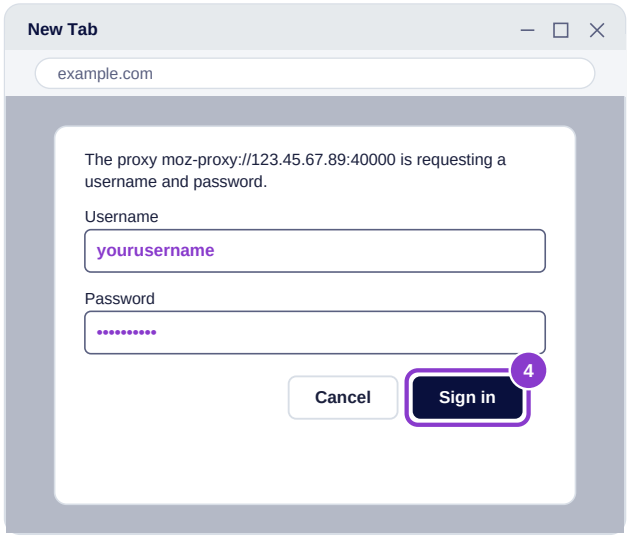
Menu › Settings › Network Settings › Settings…



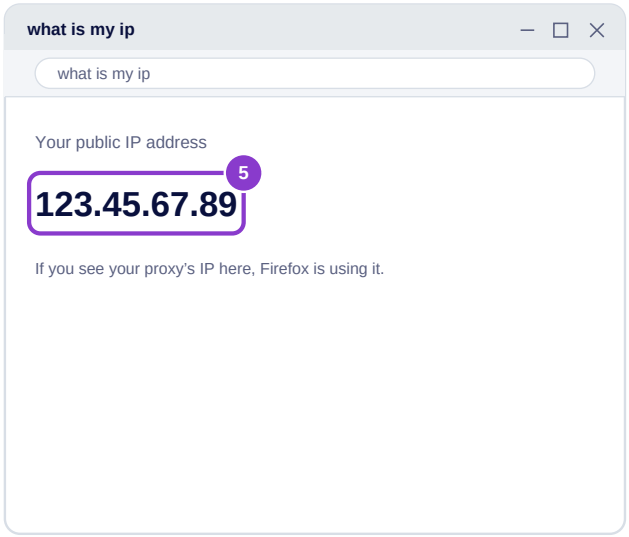
1 Open the menu (three lines) › **Settings**, type **proxy** in the search box, then click **Settings…** under Network Settings.



2 Choose **Manual proxy configuration**. Put your IP in **HTTP Proxy** and your port in **Port**, and tick **Also use this proxy for HTTPS**. 3 Click **OK**.



4 Open any website. Firefox asks for your **username** and **password** once. Enter them and click **Sign in**.



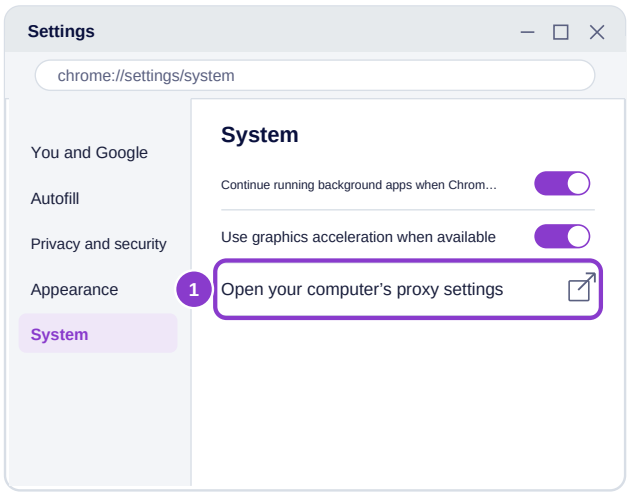
5 Search **what is my ip**. You should see your proxy's IP, not your own.

To stop using the proxy, go back to the same window and choose **No proxy**.

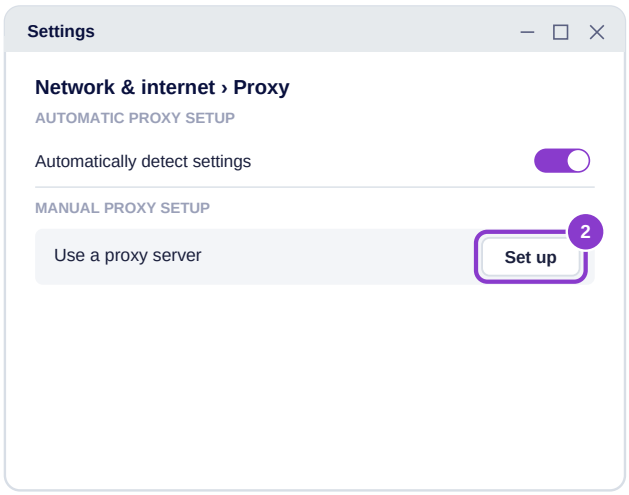
Method 4 — Chrome on Windows

Chrome has no proxy settings of its own. It uses the Windows ones, so this sets the proxy for your whole computer, and other apps will follow it too.

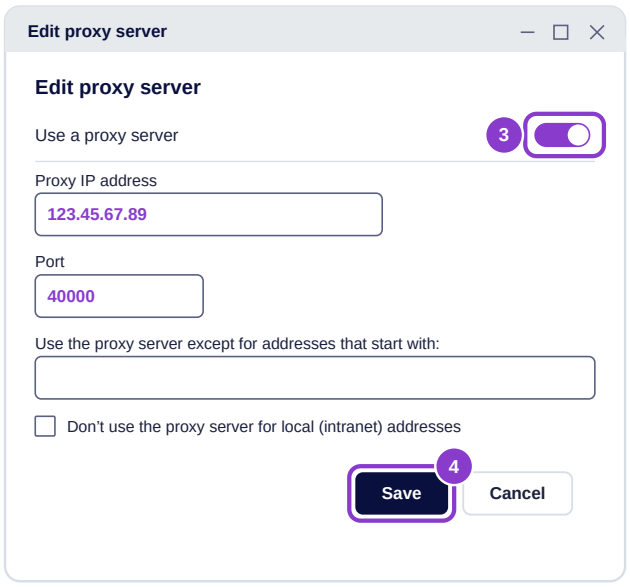
Menu › Settings › System › Open your computer's proxy settings



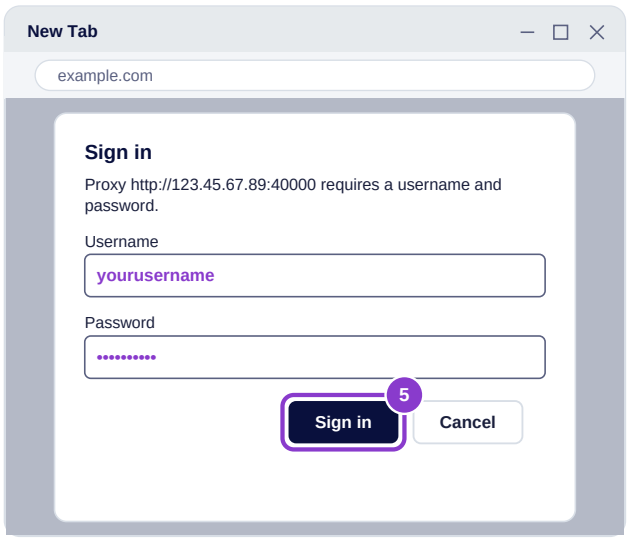
1 In Chrome, open the menu (three dots) › **Settings** › **System**, then click **Open your computer's proxy settings**.



2 Windows opens its **Proxy** page. Next to **Use a proxy server**, click **Set up**.



3 Turn **Use a proxy server** on, then enter your IP and port.
4 Click **Save**.



5 Open any website. Chrome asks for your **username** and **password** once. Enter them and click **Sign in**.

- **To stop using the proxy:** open the same Windows page, click **Set up**, turn **Use a proxy server** off and click **Save**.
- **On Windows 10** there is no Set up button: the **Use a proxy server** switch, **Address** and **Port** sit directly on the Proxy page.
- **On a Mac**, Chrome opens System Settings instead. Use **Web Proxy (HTTP)** and **Secure Web Proxy (HTTPS)** with your IP and port, and turn on the password option.

Checking it is working

Search “what is my ip” on the device or browser you set up. If it shows your proxy’s IP, you are connected. If it shows your normal IP, the proxy is not being used. Check the port and the password first, as those are the two most often mistyped.

If your proxy starts lagging

It rarely happens, but you can swap it for a fresh IP in the same country at any time within your one-month subscription. Open **Our Services** › **Proxies** › **Manage Proxies** and choose **Swap IP**.

Renewing

We message you two days before your proxy expires, with a renew button. Renewing keeps the same IP. You can also renew the same subscription, or order a new proxy, under **Our Services** › **Proxies** › **Manage Proxies**.

If it lapses before you renew, the IP goes back to the pool and we can’t promise you will get the same one again, so renewing early is always safer.

If you need a specific US state

Our proxies are selected by country rather than by state, so there is no state option in the menu. If you need a particular state, tap **Contact Support** and tell us which one. We arrange those by hand.

If something is not working

- Check the port and password first.
- In the apps, make sure the type is **SOCKS5**.
- In Firefox, Chrome and the iPhone Wi-Fi method, make sure the details are in the **HTTP** proxy fields.
- iPhone Wi-Fi method won’t connect? Some Wi-Fi networks block it. Use Potatso instead.
- Still stuck? Tap **Contact Support** and send us your IP. We will check it from our side.

> **The short version**
>
> **iPhone:** Potatso, type SOCKS5. **iPhone on Wi-Fi, optional:** Settings › Wi-Fi › (i) › Configure Proxy › Manual. **Android:** Super Proxy, protocol SOCKS5. **Firefox:** Settings › Network Settings › Manual proxy configuration, HTTP Proxy. **Chrome on Windows:** Settings › System › Open your computer’s proxy settings. The same four details everywhere.
