

WorksNet

Proxy Setup Guide

SOCKS5 • Firefox, Chrome & Mobile

This guide walks you through configuring your WorksNet SOCKS5 proxy on desktop browsers (Firefox, Chrome) and mobile devices (iOS, Android). Your proxy does not require a username or password — only the host address and port shown when you receive your proxy.

1. Before You Start
2. Firefox Setup (Windows & Mac)
3. Chrome / Brave / Edge Setup (Windows & Mac)
4. iOS Setup (Potatso)
5. Android Setup
6. Verifying Your Connection
7. Troubleshooting
8. Support

1. Before You Start

When you purchase a proxy through WorksNet, you'll receive an IP address (host) and a port number. That's all you need — your WorksNet proxies do **not** require a username or password.

No authentication needed. When a setup screen asks for a username or password, simply leave those fields blank and continue.

Choose the section below that matches how you plan to use your proxy:

- **Firefox** — supports SOCKS5 natively, no extension needed
- **Chrome** — requires a free extension, since Chrome has no built-in SOCKS5 option
- **iPhone/iPad** — use the free Potatso app
- **Android** — use a dedicated proxy app, since Android has no built-in SOCKS5 support

2. Firefox Setup (Windows & Mac)

Firefox is the easiest browser to use with a SOCKS5 proxy, since it supports it directly in its settings — no extension required.

- 1 Open Firefox and click the menu button (three horizontal lines) in the top-right corner, then select **Settings**.
- 2 Scroll down to the **Network Settings** section near the bottom of the General tab, and click **Settings...**
- 3 Select **Manual proxy configuration**.
- 4 In the **SOCKS Host** field, enter your proxy's host/IP address. In the **Port** field, enter the port number.
- 5 Select **SOCKS v5** as the proxy version.
- 6 Check **Proxy DNS when using SOCKS v5** to prevent DNS leaks (recommended).
- 7 Leave the Username and Password fields blank — your WorksNet proxy does not require them.
- 8 Click **OK** to save. Your traffic will now route through your proxy.

Firefox — Network Settings

Configure Proxy Access to the Internet

☐ No proxy

☐ Auto-detect proxy settings for this network

☐ Use system proxy settings

☒ Manual proxy configuration

SOCKS Host **Port**

185.xxx.xxx.xxx 1080

☐ SOCKS v4 ☒ SOCKS v5

☒ Proxy DNS when using SOCKS v5

No Proxy for

localhost, 127.0.0.1

Cancel OK

Example of Firefox's Manual Proxy Configuration screen with SOCKS5 selected.

To disable the proxy later, return to the same screen and select **No proxy**.

3. Chrome / Brave / Edge Setup (Windows & Mac)

Chrome, Brave, and Edge don't have a built-in way to configure a SOCKS5 proxy, since they all share the same underlying browser engine. The most reliable way to use one is through a free extension.

Recommended: SwitchyOmega (ZeroOmega)

- 1 Open the Chrome Web Store and search for "**Proxy SwitchyOmega**" (also listed as **ZeroOmega**). Click **Add to Chrome**.
- 2 Once installed, click the SwitchyOmega icon in your toolbar and select **Options**.
- 3 Create a **New Profile**, name it (e.g. "WorksNet Proxy"), and choose **Proxy Profile** as the type.
- 4 Under Protocol, select **SOCKS5**.
- 5 Enter your proxy's **host/IP address** and **port**. Leave the username and password fields blank.
- 6 Click **Apply Changes** to save.
- 7 Click the SwitchyOmega icon and select your new profile to activate it. Select **[Direct]** at any time to turn the proxy off.

A screenshot of the SwitchyOmega extension's 'Proxy Profile' configuration window. The window has a title bar with three colored dots (red, yellow, green) and the text 'SwitchyOmega — Proxy Profile'. Inside the window, there are several input fields and a button. The 'Profile Name' field contains 'WorksNet Proxy'. The 'Protocol' dropdown menu is set to 'SOCKS5'. The 'Server' field contains '185.xxx.xxx.xxx' and the 'Port' field contains '1080'. Below these are two empty input fields for 'Username (leave blank)' and 'Password (leave blank)'. A blue button labeled 'Apply Changes' is located at the bottom right of the form area.

Example of a SwitchyOmega proxy profile configured for SOCKS5.

Note: These steps work identically whether you're using Chrome, Brave, or Edge — just install the extension in whichever browser you're using.

4. iOS Setup (Potatso)

iOS's built-in Wi-Fi proxy settings only support HTTP/HTTPS, not SOCKS5. **Potatso** is a free, widely-used app that adds full SOCKS5 support to iPhone and iPad.

- 1 Download **Potatso** for free from the App Store.
- 2 Open Potatso and tap **Add a Proxy**.
- 3 Under the **Manual Input** section, tap **Add**.
- 4 Set **Type** to **SOCKS5**.
- 5 Enter your proxy's **Host** (IP address) and **Port**.
- 6 For Authentication, leave it set to **None** — your WorksNet proxy does not require a username or password.
- 7 Save the profile, then tap the **Play** icon to activate it.
- 8 If prompted, tap **Allow** and enter your device passcode so Potatso can add a VPN configuration profile (this is how it routes traffic on iOS — it does not mean you are using a VPN service).

Example of the Potatso "Add Proxy" screen with SOCKS5 selected and Authentication set to None.

5. Android Setup

Android's system Wi-Fi settings do not support SOCKS5 proxies. A dedicated proxy app is required to route your traffic through a SOCKS5 connection.

Recommended apps

- **Postern** — free, supports SOCKS5, widely used
- **Drony** — free, supports per-app proxy routing

- 1 Install **Postern** (or Drony) from the Google Play Store.
- 2 Open the app and create a new proxy profile.
- 3 Set the proxy type to **SOCKS5**.
- 4 Enter your proxy's **Host** (IP address) and **Port**.
- 5 Leave the username and password fields blank — no authentication is required.
- 6 Save and activate the profile. The first time you connect, Android will ask permission to add a VPN configuration — tap **OK** to allow it. This is how these apps route traffic on Android; you are not connecting to a VPN service.

Example of a Postern-style proxy profile screen with SOCKS5 configured.

Only install proxy apps from the official Google Play Store. Avoid APK files from third-party websites, as these carry a higher risk of containing malware.

6. Verifying Your Connection

After setting up your proxy on any device, confirm it's working correctly:

- 1 Open a browser (with the proxy active) and visit a site such as **whatismyipaddress.com** or **ip.me**.
- 2 Check that the IP address shown matches the proxy IP you were given — not your real IP address.
- 3 If the IP shown is your real IP, double-check that the proxy is switched on and that the host/port were entered correctly.

7. Troubleshooting

Q: The browser is asking me for a username and password.

A: Your WorksNet proxy does not require authentication. Leave these fields blank, or check that you entered the host and port correctly — a typo can sometimes trigger an authentication prompt.

Q: My internet stopped working after setting up the proxy.

A: Double-check the host and port are entered exactly as provided, with no extra spaces. Confirm you selected SOCKS5 (not HTTP/HTTPS) as the proxy type.

Q: Pages are loading slowly.

A: This can happen depending on your location relative to the proxy server, or current network conditions. Try disabling and re-enabling the proxy, or contact support if the issue persists.

Q: How do I turn the proxy off?

A: Firefox: set Network Settings back to "No proxy" or "Use system proxy settings." Chrome: select [Direct] in SwitchyOmega. Potatso/Android apps: tap the Stop or Disconnect button in the app.

8. Support

If you run into any issue not covered in this guide, reach our support team directly through the bot — no separate account or email needed.

- 1 Send the command **/support** to the bot, or tap **■ Contact Support** from the main menu.
- 2 Describe your issue, including which device/browser you're using and your proxy details if relevant.
- 3 Your message will be forwarded directly to our support team, and you'll receive a reply as soon as possible.
